Prompts Used

I gave Claude the course website, specifically the link to Sprint 5. Since I was working in the CLI, Claude had access to the codebase and understood to a degree what I was asking of it. The initial frontend it gave me was horrendous. I told Claude something along the lines of “create a frontend based on the codebase using these sprint requirements.” I then saw the initial version of the frontend and said something along the lines of “that shit looks like butt please rebuild it using the frontend-skills skill.” Claude then remade it and made it look even more vibe coded. So, I told it “make it look like the Mac terminal, that would be cool.” It then started speaking to me in Ebonics for whatever reason and tried to make a version of the frontend based on the Mac terminal. Again, it looked horrible and was unintuitive. I then told it, “It still looks vibe coded as hell, please rebuild it with this in mind” and I attached an image of the Mac terminal. It finally gave me what I wanted visually, but it was unintuitive as the user had to use their mouse to click on the severity options rather than use the arrows to navigate as you would in a terminal. I told it “Fix it so you use the keyboard ONLY and no mouse unless it’s to begin typing. This does NOT mean that you can click on typed text to traverse the text editor, but it means that when you click it “focuses” the text prompt.” After that prompt, it finally gave me what I wanted visually. We did not go with my design, though since everyone agreed that it was OD for this assignment, and Raiden’s version was the most intuitive and simple to use.
